Problem Statement

Tourism is booming — but safety information is broken.

No Real-Time Safety Data

- Tourists have no way to know if a place is safe before or during travel
- Existing maps show routes — not crime history or safety scores
- Safety data is scattered across news, police reports & govt advisories

Emergency Response Gaps

- SOS in remote/low-connectivity areas often fails entirely
- Emergency contacts and police are notified too slowly or not at all
- Tourists don't know the nearest hospital, police station or pharmacy

No Unified Tourist Platform

- No single app combines safety scoring, heatmaps, SOS & place info
- Authorities lack real-time crowd data to deploy resources effectively
- Disaster alerts are not location-aware or travel-context aware

Core Safety Features

Feature 1 — Safe Score System

- Data: NCRB annual data + real-time News APIs (TOI, NDTV) + Google Maps traffic + Community Reports + Govt Travel Advisories
- Score out of 10 — Dynamic deduction on verified crime events; score never recovers
- Separate Day Score & Night Score per locality
- Crime weightage: Murder/Rape -3.0 | Robbery -2.0 | Theft -1.0 | Vandalism -0.5

Feature 2 — Safety Heatmap

- Full city map with color-coded zones: Dark Red (0-3) | Orange (4-6) | Green (7-10)
- Updates dynamically when Safe Score of a locality changes
- Toggle: Day View / Night View (scores differ)
- Pinch to zoom — city level → locality level granularity

Feature 3 — Safe Route Recommendation

- Route split into 500m segments, each scored on: Safe Score, street lighting, isolation level, police proximity, high-risk zones
- Final score = 60% avg of all segments + 40% worst segment
- Adjusted for time of day; up to 3 routes ranked and displayed
- Color coded: ● SAFEST | ● MODERATE | ● AVOID — user can override

Feature 4 — SOS Button

- Triggers: Red button, Shake gesture, Smartwatch
- 10-sec countdown → auto-fires if no action
- Sends GPS, battery %, temperature to nearest police station (112 API)
- Emergency contacts get live location link instantly

Feature 5 — Offline Layers

- L1: Panic button without network — queued SOS fires on connectivity
- L2: Bluetooth Mesh via Bridgefy SDK (~100m per hop)
- L3: Dead Man's Switch — auto-alert if user misses check-in deadline
- L4: Smartwatch (Apple Watch + WearOS) — heart rate, fall detection

End User Details

Tourist (Primary User)

Who They Are

- Domestic & international travellers visiting new cities
- Solo travellers, families, students on educational trips
- Age group: 18–55, smartphone users

Their Pain Points

- Don't know which areas are safe — especially at night
- No reliable SOS in remote or low-connectivity zones
- Can't find nearest hospital/police quickly in an emergency

What They Need

- Real-time safety scores & heatmaps before exploring
- One-tap SOS that works offline
- Live location sharing with family + nearest help finder

Authority (Police / Admin)

Who They Are

- Police officers, city administrators, tourism boards
- Emergency response coordinators & disaster management teams
- Verified users — require activation code to access

Their Pain Points

- No real-time visibility of tourist crowd density or hotspots
- Reactive response — act after incidents, not before
- Cannot plan evacuation or force deployment proactively

What They Need

- Live crowd heatmap (Low/Moderate/High/Critical density)
- Real-time SOS alerts with GPS payload from tourists
- Tools to plan force deployment and evacuation routes
